BM ROAD SERVICE SYSTEM™

Combined Weather & Network Management Solution

Improve your productivity by managing critical winter weather data and fleet efficiency. The BM Road Service System uses advanced GPS technology so that you can plan, optimise routes, dispatch actions, navigate and monitor treatments.

- GPS tracking & decision support weather data
- Limitless route optimisation
- Proven technology dynamically calculates routes saving time and costs by 20-35%
- Minimise fleet and labour usage
- Schedule standard or customised reports
- Audio and visual navigation
- Auto salting functionality
- Manage road defects
- Know when your team and vehicles are active / off-call
- Works with existing GPS hardware
- Minimise paperwork
- Track your fleet in real time

The system offers up to the minute weather information from your forecaster and RWIS units, enabling you to make informed decisions in line with your code of practice. All vehicle movements and actions are recorded and held for easy access at a later date. Scheduled standard and customised (including exception) reports are set-up at the push of a button.

Route optimisation

Create, update and optimise the efficiency of your routes. These can be changed adhoc based around your current parameters and priorities. Ideal to manage a range of routes to include but not limited to snow, cycle, high/low ground, and diversions. The system updates vehicle navigation remotely with any changes.

Dynamic route optimisation

Using forecast and observation weather feeds dynamic routing calculates the most efficient and cost-effective way to treat critical areas of your network. The reduction of vehicle use and labour allows other works to be completed, proactively managing daily duties.

Dispatch

Notify operatives of their duties via an app, minimising the need for supervisors to call or text. The system also records live acknowledgement of the call-out status, action initiated and timings.

Navigation

Multi map navigation options with audio. The navigation screen alerts the driver when to turn salt on/off and/or to plough. Auto-salting feature is also available to avoid under/over application and aid driver safety. Off-route alerts and the ability to report back any road restrictions or break-down issues instantly to the management team.

Tracking

Monitor and manage your fleet with live feed tracking. View your vehicles via various map options or 24/48hr historic timeline showing the type of work they are carrying out with stop/start times and any deviations. Facility to search locations and timelines for quick and simple verification.

Highway maintenance

Module to easily log and report network defects via the system app, complete with images and location. Create works orders, timescales and follow up with costings.
