Safecote Liquid Additive

For Salts & Brines Offering Increased Efficacy, Less Corrosion & Better Spreadability

Safecote Liquid Additive is a patented technology offering many benefits whether it's added to rock/marine salt or mixed with sodium chloride brine.

More than 50 councils and private contractors across the UK already benefit from its natural, environmentally friendly ingredients.

Pre-wetted

Untreated

Safecote treated

The fight against corrosion

Research has proven that our Safecote Liquid Additive can reduce the effects of Chloride by up to 80%.

The images above show the comparisons from pre-wetted, untreated and Safecote treated chloride on plates fitted to the salt skirts of salting vehicles.

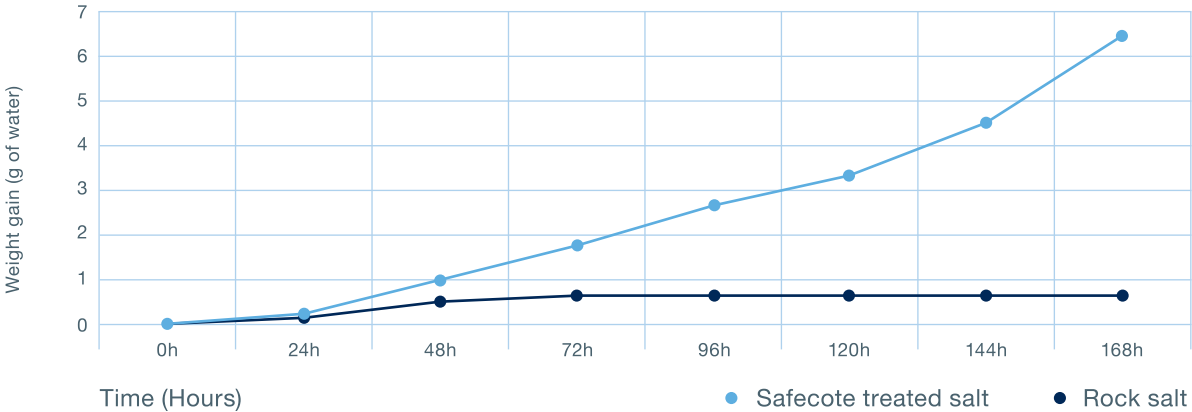

Increased performance

Safecote Liquid Additive can be mixed at 10% W/W with sodium chloride brine to be effective to -19°C and de-icing salt at 3% W/W to be effective to -12°C.

Works better for longer

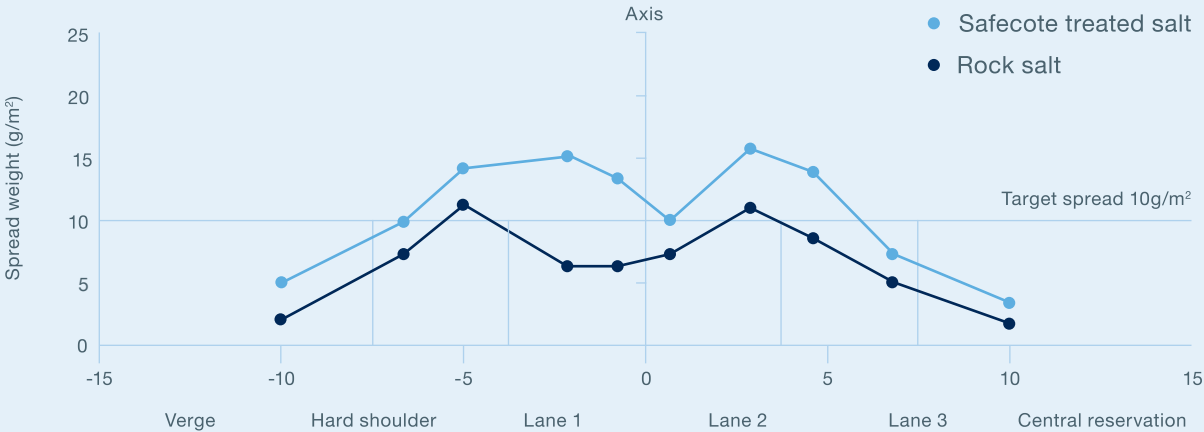

Saving money and making your supplies go further, Safecote treated rock salt absorbs moisture over a full 7 days. Keeping the chloride in solution ensures it's active on the road surface for longer than untreated rock salt.

Water vapour absorption of Safecote treated salt versus rock salt

Improved distribution

Safecote treated rock salt offers a more consistent spread distribution pattern of up to 35-40% when compared to untreated rock salt, as shown in tests carried out by the Transport Research Laboratory at their Crowthorne test track, allowing a reduction in spread rates and improving network resilience.
