The perfect way to store de-icing salt - protecting your material long-term

Economic timber salt storage solutions are tailored to your needs offering easy access and multiple sizes to fit all requirements.

The new Appendix H winter service guidance document suggests that all de-icing salt should be stored under cover to maximise the performance of the product. Timber has long been recognised as the ideal material to use for salt storage due to its' inability to corrode when storing chlorides. Safecote can now offer timber salt storage solutions to fit all your needs. From small, transportable, easy to access silos for pedestrianised areas that will hold 3 to 12 tonnes of salt, to large storage barns that can be designed to facilitate any capacity with a minimum 20 year lifespan. Made from spruce timber to give an aesthetically pleasing landscape to any location, these silos and barns offer huge environmental benefits when compared to externally stored stockpiles, or even temporary sheeting systems. The barns are designed with either 5m or 9m doors, allowing easy delivery and loading of material within the building to further reduce environmental impacts.

Key benefits

- > Environmentally friendly materials
- > Extensive life
- > Ability to tip/load inside
- > Salt protection
- > Increasing network resilience
- > Integrated vehicle shelter option
- > Multiple sizes available
- > Multiple colour options
- > Linked to feed salt for brine production
- > Gate clearance up to 9m
- > Internal clearance up to 9.3m
- > Modular construction
- > Natural air circulation within the barn
